## Clif Tipon - Notes on Sketches

The sketches I made are based on two scenarios: a person needing to do errands using the service. The idea is to sync the service with the user's To Do list and will sort of work in this flow:

1. Make a to do list
2. Order the car service
3. App will sync to do list (errands) based on most efficient route
4. App will display map route and estimate time to complete (travel time only)
5. Service picks up user and she goes through completing the errands
